

The TRUTH about child transition

Children are being sterilised and medicalised for life in the name of gender identity politics

There is no historic evidence of the existence of 'transgender' children

There is no established diagnostic criteria for 'transgender' children

Gender dysphoria resolves naturally for the majority of children during adolescence

Cross-sex identity in childhood is overwhelmingly predictive of gay or lesbian sexual orientation in adulthood, not transsexualism

There is no established criteria to judge which children will persist

There is no research into the long-term health effects of treatments

The effects of blockers on a child's developing brain are unknown

Puberty blockers + cross-sex hormones = sterilisation of children

Almost all children on blockers progress to cross-sex hormones

Children are made medical patients for life, with the associated risks

The unprecedented increase in referrals to gender clinics of teenage girls with Rapid Onset Gender Dysphoria is a completely new phenomenon

Even short-term hormone use leaves irreversible effects on the bodies of young people who want to 'transition back'

This is an unprecedented medical experiment on children

Facts and figures

Since children have been taught about 'gender identity,' calls to Childline from children worried about their gender have doubled to eight calls a day from children as young as

11

'Rapid onset gender dysphoria' is thought to be linked to internet use and social contagion

In a study of young women who regret their transition, 94% said they did not receive adequate counselling before starting a path of medical transition so underlying problems were not resolved

Nearly **70%** of referrals to the Tavistock gender clinic last year were girls and over 70% of adolescent referrals were girls

There has been a nearly **1,000%** increase in children referred to the Tavistock child and adolescent gender clinic over the past six years.

Most children who start puberty blockers progress to cross-sex hormones at age

16,

leaving them infertile; very few come off the path of increasingly invasive medical treatments once they start.

There is no research into the long-term effects of these treatments on children

Extreme gender non-conformity in childhood and adolescence is more predictive of gay or lesbian sexual orientation

Childhood gender dysphoria naturally resolves during adolescence in around

80% of cases

Increasing numbers of young people referred to the Tavistock clinic have significant associated mental health issues and troubled backgrounds

Around **35%** of young people referred to the Tavistock clinic present with moderate to severe autistic traits
